

Gentlemen:

I am adamantly opposed to the implementation of "BPL" by power companies for any purposes. The use of such power line signals is a destructive threat which is capable of destroying The Amateur Radio Service throughout HF into low VHF.

It is interesting that the Amateur Radio allocations and obsolete public service frequencies were singled out for these commercial purposes. Certainly, a threat to commercial television would not be tolerated. Why is such a threat OK for consideration in Amateur Frequencies. The answer is clear - they generate no commercial revenue by the FCC rules. These frequency allocations must remain undisturbed as intended and upheld for almost 100 years.

This proposal is a threat to the Amateur Radio Emergency Services recently lauded by The FCC Chairman himself. It seems hypocritical to advocate destruction of the same services. The FCC must reject any frequency allocations for the purposes of "BPL". The technology is a nightmare for the power companies as it stands.
